

Work From Home Guidelines

General :

Please make use of the following guidelines to improve your work-from-home experience.
Guidelines for working from home:

1. Prepare a Workspace

Preferably, arrange a proper workspace to comfortably work with, which includes a good chair, table (or similar tools), proper lighting, and a comfortable temperature. Also, it is advisable to arrange the workspace away from disturbance from family members or others (Example: Closed room). This will help you stay focussed and avoid health issues (Back pain, Burning eyes). Please find the image for reference.

2. Get dressed as if you are in Office.

Try to wear a proper dress during work hours, like when you are in Office, to get the proper work mood and be ready for Video calls any time with Colleagues or Clients if they ask.

3. Schedule things

Don't be over-relaxed as you have more time at home. Schedule things as you are in Office and work to improve efficiency.

4. Stay accessible, responsive and reliable

Be online in Skype / Slack during our Working hours and try to reply to your messages and emails ASAP. This will help all other employees to reach you easily.

5. Stay connected

You meet, talk and laugh in the Office. So don't shy away from the conversation even over the internet. Social interaction helps you look after your mental health.

6. Don't Overwork yourself.

Take regular breaks and sign off at the end of the day, which can also improve your productivity and avoid burnout.

7. Work out daily

Take a walk frequently, do stretching, and do possible workouts every day to maintain good health.

Safety Measurements For Mac and Other Assets:

Electrical / Grounding:

We can follow the below steps to safeguard the device from power fluctuations, lightning, etc.,

- 1) Make sure that your home's electricity is properly grounded (earthed). You may not be aware of this much, and you can check with your electrician to make sure that it is grounded even if it was not handled earlier.
- 2) Try Wi-Fi wherever possible instead of connecting with Ethernet.
- 3) Connect your Mac through an inverter / UPS / Stabiliser / Surge protector, If you have them at home.
- 4) Try not to charge your Mac at night, some times power fluctuations happen in some areas, which might affect the device.

Battery charge / Heat:

- 1) Try to charge your Mac in idle times, like a couple of hours before work starts, during breaks, lunch, or a couple of hours after work.
- 2) Keep the Mac in Sleep mode while charging it, by doing so, we can reduce the Mac from overheating. Usually, it gets hotter when you work on heavy tasks and also charge it simultaneously.
- 3) If you feel abnormal heat from your Mac, please check with the Network team immediately.
- 4) Don't let the battery dry to a very lower percentage. If you see the battery percentage around 30 - 50, then start charging it, once it reaches 100 then unplug it.

These are suggestions to handle the heat, so if you are running out of charge in the middle of work, don't hesitate to charge it.

General follow-ups:

- 1) Shut down your Mac after finishing your work at the EOD.
- 2) Check your Power socket whether it is properly inserted. Some sockets may not be tight enough, which ends up creating some friction in passing the electricity through them.
- 3) If your Mac gets hot, keep it in sleep mode for a couple of mins and then continue. But you can ignore this idea if you need to do this cycle (sleep/work) more often.
- 4) Always place your Mac on a flat surface so that the airflow doesn't get affected. Make sure proper air circulation is happening at the place of your work.

If you have any issues or doubts, please contact the Network team.

Internet Recommendations:

1. Please have a separate private internet service in your home. Public internet is not recommended.
2. Minimum internet bandwidth should be 5 Mbps to 8 Mbps consistently (Both download and upload speed). If you are using a mobile data connection, please make sure you are working in a place where you have enough network coverage.
3. The minimum daily internet data limit should be 3 GB to 5 GB. When you want to do software updates or download any big files, please have some buffer data size.
4. It is recommended to have a backup internet option which you can use when your main provider is down.
5. For security reasons, usage of VPN tools/apps is prohibited during Office work. Please let the network team know in case of any exceptional needs.

Please follow the above recommendations to avoid internet issues. In case of any issues/difficulty in this, please don't hesitate to get back to us. We are ready to help, and the network team will get in touch with you.

References:

1. To monitor internet data usage, you can use Mac's Activity Monitor tool (Network tab) or can use third-party tools like Bandwith+ for enhanced monitoring.
2. To monitor the bandwidth, please use the Speed Test website (<https://www.speedtest.net/>) / Mac app.
3. If you really need to use VPN (after confirming with the network team), try to use secured tools like TunnelBear, HideMe, and ProtonVPN to avoid data theft. These tools have free tier usage up to a certain level, and we hope that should be enough for our usage as we are going to use it only for exceptional cases. Speedtest by Ookla - The Global Broadband Speed Test <https://www.speedtest.net>

Power Interruptions:

In work from home, power interruptions are a major issue for many of us. So, we suggest you do some proactive measures to reduce the productivity loss due to power interruptions.

1. Please connect the Mac/Laptop/System always to a power source while working. So that Mac/Laptop/System will use a direct power source till power is available and use a battery power source when there is any power outage. This will reduce our idle times in day time.
2. Try to use night times to charge your Mac/Laptop/System, Internet modem, headphones, etc., if possible. So that we will have longer battery backup though there is a power shutdown from the morning.
